A CHECKLIST OF THE VASCULAR FLORA OF THE PORONGURUP NATIONAL PARK, WESTERN AUSTRALIA

By GREG KEIGHERY

Science and Information Division,
Department of Conservation and Land Management,
Woodvale, P.O. Box 51, Wanneroo, WA, 6065

ABSTRACT

The Porongurup National Park contains a flora of at least 822 species of vascular plant. Of these 709 are natives and 113 are weeds. A feature of the range is the number of wet temperate species, including one of the dominant trees (Karri-*Eucalyptus diversicolor*) at their inland margins. There are 10 taxa endemic to the range and brief notes are given on their biology.

INTRODUCTION

The Porongurup National Park (Reserve 18978) is found approximately 35 kilometres north-east of Albany and encompasses within an area of 2,511 hectares the bulk of the Porongurup Range. This granite range rises to a maximum height of 670 metres at Devil's Slide and runs in an east-west direction.

There have been two previous lists of vascular plants prepared for the ranges.

The first list was compiled by members of the Botany Department, University of Western Australia from student field camps and granite rock studies (Smith, 1962) and listed 221 species (Botany Department, 1970). The second by Abbott (1982) listed the flora of the Range itself, above 300 metres and listed 368 species.

The current list is based on these previous lists and extensive field survey of the endemics of the Range mainly undertaken in 1986 and 1987.

RESULTS

The major vegetation formations listed for the Range by Beard (1976) are Jarrah (*Eucalyptus marginata*) and Marri (*Eucalyptus calophylla*) tall to low forest to low woodland which occurs on lower slopes and poorer sandy, duplex or lateritic soils. In this vegetation community a diverse range of shrubs and herbs form the understorey. Karri (*E. diversicolor*) tall forest centred on the creek lines and lower slopes of the range. This forest has a variable understorey of tall shrubs of *Acacia urophylla*, *Trymalium floribundum*, *Hibbertia serrata*, *Pimelea sylvestris* and vines such as *Clematis pubescens* and *Kennedia coccinea*.

Rising above the Karri forest are the bare granite domes of the range, these granite areas contain moss fields, with their associated herbfields (Smith, 1962). Along the rock rills and in depressions where deeper soils are found are shrublands of *Brachysema subcordatum*, *Acacia heteroclita* and *Agonis linearifolia* over sedges of *Lepidosperma gladiatum* and herbs such as *Stypandra glauca*. Between this community and the Karri forest are low woodlands of Bullrich (*Eucalyptus megacarpa*) of Yate (*Eucalyptus cornuta*) often with a similar understorey to the rills.

There are also number of minor communities which Beard did not map separately, including small areas of Mallee heath dominated by *Eucalyptus tetragona* or *Eucalyptus decipiens*. Another small community *Melaleuca preissiana* low woodland over *Pericalymma ellipticum* shrubland wetland on the western Margin of the Park, contains numerous wetland species only recorded from this area and is thus listed separately in Appendix I.

Current records of the vascular flora present inside the boundaries of the national Park are given in Appendix I. These records are listed under the major vegetation types of Jarrah, Karri, granite slopes, but also includes the western swamp.

Despite it's small size and limited range of habitat's the flora of the park is rich, being composed of over 822 (709 natives and 113 weeds) taxa of vascular plants. Of these 10 are Ferns and Fern allies, 222 are Monocotyledons and 590 are Dicotyledons.

There has been a long history of disturbance in the Park from grazing, timber cutting, partial clearing, roads for stock transportation and settlements (Burchell, undated) which has resulted in the introduction of many alien plants and created the disturbed areas for their establishment. Of the 113 taxa of weeds in the park, the major weeds are along creek lines are Blackberries (*Rubus* species), Forget Me Nots (*Myosotis sylvatica*). In areas of past disturbance Dolichos Pea (*Dolichos lignosus*), Silky Wattle (*Acacia dealbata*), Taylorina (*Psoralea pinnata*). Potentially very serious weeds (Arum Lily and Watsonia) of these areas are present in the park. As illustrated by Taylor (1990) annual grasses are a major threat to the granite rock communities. Control of these weeds is discussed in the recent draft management plan (Herford et al, 1997).

The largest families are the Cyperaceae (31 natives, 2 weeds), Orchidaceae (57 natives, 1 weed), Poaceae (17 natives, 17 weeds), Asteraceae (38 natives, 16 weeds, Epacridaceae (31 natives), Mimosaceae (21), Myrtaceae (44), Papilionaceae (47 natives, 11 weeds) and the Proteaceae (52 natives).

GEOGRAPHICALLY SIGNIFICANT RECORDS

Because of the granitic soils and run-off from the range there are a number of species at the inland margins of their ranges. These taxa include:

Adiantum aethiopicum, *Carex appressa*, *Dampiera hederacea*, *Darwinia citriodora*, *Eucalyptus diversicolor*, *Gonocarpus diffusus*, *Hakea falcata*, *Hibbertia serrata*, *Hydrocotyle plebeja*, *Isolepis inundata*, *Lysinema lasiantha*, *Ozothamnus ramosus*, *Persoonia elliptica*, *Picris angustifolia*, *Rorippa dictyosperma*, *Scaevola auriculata*, *Senecio ramosissimus*, *Trachymene anisocarpa*, *Thryptomene saxicola* and *Xanthorrhoea gracilis*.

While most plants of the park are normal components of the Jarrah, Karri and granite rocks in the higher rainfall areas of southern Western Australia. Many of the normal important components of the Karri forest are absent, notably Karri Wattle (*Acacia pentadenia*), Karri Oak (*Chorilaena quercifolia*) and *Lasiopetalum floribundum*.

Only one species appears to be at its south-western margin in the park, this is *Calectasia grandiflora*.

ENDEMICS OF THE RANGE AND THEIR BIOLOGY

There are 5 species (*Brachysema subcordatum*, *Billardiera granulata*, *Hibbertia bracteosa*, *Villarsia calthifolia* and *Villarsia marchantii*) and 5 subspecies/varieties. (*Acacia drummondii* ssp. *elegans* (Porongurup variant, R.J. Cummings 938), *Acacia heteroclita* ssp. *valida*, *Apium prostratum* ssp. "phillipii", *Conospermum caeruleum* ssp. *adpressum* and *Stylidium corymbosum* var. *proliferum*) endemic to the Range. Brief notes are presented on their distribution and biology.

Acacia drummondii ssp. *elegans* (Porongurup variant, R.J. Cummings 938). This low shrub is found on lateritic and loam soils in Jarrah forest of the western half of the range. Killed by fire and occurs abundantly after fires. This taxon like *Conospermum caeruleum* ssp. *adpressum* probably occurred outside the range before clearing.

Acacia heteroclita ssp. *valida*. This large spreading shrub occurs between Yalperungup and Twin Peaks around the base of the granite rock sheets or along rock rills. Killed by fire, regenerates from seed.

Apium prostratum ssp. *phillipii* ms An erect perennial herb from a tuberous rootstock. Confined to creeklines in Bullich or Karri forest near the base or below the granite slopes. Pollination and response to fire unknown.

Brachysema subcordatum This is a suckering shrub, confined to rills, often dominating this vegetation between Yalperungup and Castle Rock. Pollinated by birds. Adult plants are killed by fire, massive seedling regeneration occurs after fires. First flowering occurs 2–3 years after the fire.

Billardiera granulata A slender vine to 5 metres. Killed by fire, occurring in abundance after fires often dominating the shrub layer in burnt Bullich stands for 5–10 years after fire. Pollinated by solitary bees. Occurs from Yalperungup to Castle Rock in Bullich or Yate woodlands, on rock rills and occasionally along creek lines in the Karri forest.

Conospermum caeruleum ssp. *adpressum*. A tufted slender small shrub found only in one area of heath/shrubland on coarse sands. Probably extended beyond the park on this soil/vegetation type before clearing. Pollinated by solitary

bees. Adult plants killed by fire, very susceptible to *Phytophthora cinnamomii* (dieback disease).

Hibbertia bracteosa. Unlike most Hibbertias which are low woody shrubs, this species is a spreading rhizomatous herbaceous sub-shrub. Flowering in late spring, it occurs from Yalperungup to Nancy's Peak. Pollinated by native bees and syrphid flies. Killed by fire regenerates prolifically from seed. A large number of plants died during the severe drought summers of 1986/87, however, populations have regenerated from seed, flowering in 18 months from seed.

Stylidium corymbosum var *proliferum*. A spreading stilt rooted perennial herb in moss swards on granite slopes between Nancy's Peak and Yalperungup. Killed by fire. Pollination unknown. Collections that may be this taxon have recently been collected from Mount Manypeaks.

Villarsia calthifolia. Unlike most other species which are aquatics, the following species, a short lived perennial herb from a tuberous rootstock, does not occur in water but is the only terrestrial member of the genus. Confined to shady areas on granite slopes and rock rills, occasionally under Bullich woodland between Yalperungup and Castle Rock. Killed by fire, regenerating prolifically from seed after fires. Seedlings rarely noted otherwise. Plants can flower the spring after sowing in cultivation but normally flowering occurs the next spring in the wild.

Villarsia marchantii. Like the previous species, a short lived perennial herb from a tuberous rootstock, it, however, is normally found along creeklines in the Karri forest between Castle Rock and Gibraltar Rock. At Devils Slide it does occur marginally sympatrically with *V. calthifolia* where a creek commences

on the upper slopes in a rock rill. Here there is a large hybrid zone present between the two species. Killed by fire, regenerating prolifically from seed.

Most of the endemic taxa (*Brachysema subcordatum*, *Billardiera granulata*, *Hibbertia bracteosa*, *Villarsia calthifolia*, *Villarsia marchantii*, *Acacia heteroclita* ssp. *valida* and *Stylidium corymbosum* var *proliferum*) are confined to the massive granite rocks above the forest cover. They are largely found in the western section of the park where these exposures are largest. Interestingly although they grow in relatively fire free environments, most are killed by fire and often only prolifically regenerate after sporadic summer fires penetrate the rock rills and moss swards where they grow.

DISCUSSION

Porongurup National Park despite its small size is of considerable conservation significance. It contains a rich flora of over 822 taxa of vascular plants of which 709 are native. Currently 10 taxa are endemic to the Range. Another major feature of the isolated granite range is that it harbours at least 26 vascular plant taxa at their inland margins, usually disjunct from the coast around Albany or Denmark.

The major forest tree Karri (*Eucalyptus diversicolor*) is one of these taxa. The tree is genetically distinct in this isolated area (Coates and Sokolowski, 1989) and the understorey is floristically simpler than in the main forest block extending from West Cape Howe to Manjimup. This suggests that, as noted by Churchill (1968) the Karri, and associated taxa have been isolated here for over 5,000 years as Karri contracted to its current range. Other taxa at their margins may also be genetically distinct and deserve study.

The continued conservation of this island of specific and genetic diversity is the future challenge.
